Worked examples xiv

1 Stresses, strains and Mohr circles **1**
1.1 The concept of stress 1
1.2 Simple axial stress 1
1.3 Biaxial stress 4
1.4 Mohr stress circle 10
1.5 Mohr circles for simple two-dimensional stress systems 12
1.6 Three-dimensional stress 14
1.7 Direct shear and simple shear 20
1.8 Triaxial stress 23
1.9 Pole points 25
1.10 Basic failure criteria 28
1.11 Effective stress and stress history 30
1.12 Mohr strain circle 32
1.13 Angle of dilatancy 34

2 Failure states in soil **38**
2.1 Total and effective stress circles 38
2.2 The triaxial test 38
2.3 Triaxial compression tests 43
2.4 Triaxial extension tests 60
2.5 Influence of initial stress and structural anisotropy on strength of clays 64
2.6 Orientation of rupture planes in clays 67
2.7 Influence of dilatancy on ϕ' for sands 68

3 Failure in rock **72**
3.1 The nature of rock 72
3.2 Intrinsic strength curve 72

3.3 Griffith crack theory 72
3.4 Empirical strength criteria for rock masses 74
3.5 Empirical strength criteria for intact rock 76
3.6 Strength of rock joints 81
3.7 Influence of discontinuities in laboratory test specimens 86

4 Applied laboratory stress paths 96
4.1 Mohr circles, stresses and stress paths 96
4.2 Consolidation stresses and stress paths 101
4.3 Drained triaxial stress paths 109
4.4 Influence of stress path on laboratory-measured drained strengths 112
4.5 Undrained triaxial stress paths 115
4.6 Influence of stress paths on laboratory-measured undrained strengths 118
4.7 Relative short-term and long-term field strengths 120
4.8 Infinite slope stress path 122

5 Elastic stress paths 126
5.1 Isotropic soil and soft rock 126
5.2 Undrained triaxial tests on anisotropic soil or soft rock 130
5.3 Observed effective stress paths for undrained triaxial tests 131

6 The use of stress discontinuities in undrained plasticity calculations 141
6.1 Lower bound undrained solutions 141
6.2 Smooth retaining wall 141
6.3 Stress discontinuity 142
6.4 Earth pressure on a rough retaining wall 144
6.5 Foundation with smooth base 149
6.6 Undrained flow between rough parallel platens 155

7 The use of stress discontinuities in drained plasticity calculations 159
7.1 Lower bound drained solutions 159
7.2 Smooth retaining wall 159
7.3 Effective stress discontinuity 162
7.4 Active earth pressure on a rough retaining wall 166
7.5 Passive earth pressure on a rough retaining wall 167
7.6 Smooth foundation on cohesionless soil (ϕ', $c' = 0$) 172
7.7 Silo problem 179

8 Stress characteristics and slip lines 187
8.1 Stress characteristics 187
8.2 Undrained stress characteristics 187
8.3 Drained stress characteristics 201
8.4 Rankine limiting stress states 208

8.5 Slip lines 210
8.6 Undrained deformation 213

Appendix Symbols 218
