BUILDING ON SOFT SOILS

Design and construction of earthstructures both on and into highly compressible subsoils of low bearing capacity

A.A. BALKEMA / ROTTERDAM / BROOKFIELD /1996

PREFACE XI

SUMMARY XIII

SYMBOLS XV

1 EARTH STRUCTURES ON AND IN LOW BEARING CAPACITY AND HIGHLY COMPRESSIBLE SUBSOILS 1
1.1 Introduction 1
1.2 Low bearing capacity and highly compressible subsoil 1
1.3 Earth structures 3
1.4 Geotechnical mechanisms 9
1.5 Earth structures and geotechnical mechanisms 12

2 THE DESIGN PROCESS 13
2.1 Introduction 13
2.2 Design philosophy 13
2.3 Description of the design process 15
2.3.1 Stages in the design process 15
2.3.2 Information flows during the design process 21
2.3.3 Geotechnical survey and calculation methods 22
2.4 Quality control 22
2.4.1 Design and construction 24

3 PROBABILISTIC SAFETY ANALYSIS 28
3.1 Introduction 28
3.2 General safety philosophy 28
3.2.1 Deterministic and probabilistic methods 29
3.2.2 System of partial factors 32
3.2.3 Determination of partial factors 34
3.3 Determination of the characteristic value 35
3.4 Safety level and reliability indices 39
3.4.1 Proposed reliability indices 39
3.4.2 Reliability Index per mechanism 41
3.4.3 Length factor 41
3.5 Building stage 42
3.6 Partial factors in practice 43
3.6.1 Model and material factors 44
3.6.2 Practical instructions 46

4 SOIL INVESTIGATION 48
4.1 Introduction 48
4.2 Use of archive material and maps 48
4.3 Determination of soil structure 48
4.3.1 Geophysical measurements 50
4.3.2 Cone penetration tests 51
4.3.3 Borings 53
4.3.4 Investigation costs 53
4.3.5 Schematisation 54
4.4 Measurement of groundwater levels and piezometric levels 54
4.5 Sampling 57
4.6 Determination of calculation parameters 60
4.6.1 Methods of determination 61
4.6.2 Unit weight and water content 66
4.6.3 Strength 67
4.6.4 Deformation 69
4.6.5 Permeability and consolidation behaviour 72
4.7 Approach to soil investigation 73
4.7.1 Starting points 74
4.7.2 Sequence 75
4.7.3 Type and intensity 76
4.7.4 Geostatistics 77
4.7.5 Relative costs 78
4.8 Presentation of the results 78

5 STRESSES AND DEFORMATIONS 80
5.1 Introduction 80
5.2 Calculation of the unit weight 80
5.3 Stresses 83
5.3.1 Initial stresses 83
5.3.2 Increase in stress 84
5.4 Stress deformation behaviour; analysis and calculation 85
5.4.1 Micro-scale behaviour 85
5.4.2 Approximation of the deformation behaviour 86
5.4.3 Approximation of the collapse behaviour 87
5.4.4 Elastoplastic models 89
5.4.5 Approach to the calculation of deformation and stability 91
5.5 Phenomena and mechanisms 94
5.5.1 Stress deformation relationship 94
5.5.2 Consolidation 95
5.5.3 Settlement 96
5.5.4 Failure 97
5.6 Calculation method for determination of stress distribution 98
5.6.1 Formulae 99
5.6.2 Graphs and tables 99
5.6.3 Computer programs 99
5.7 Calculation methods for determination of settlement 99
5.7.1 Anglo-Saxon method 100
5.7.2 Dutch method 102
5.7.3 'Fokkens' method 105

5.8 Calculation methods for calculating consolidation 105
5.8.1 One-dimensional consolidation 106
5.8.2 Two-dimensional consolidation 109
5.9 Calculation methods to determine overall stability 109
5.9.1 Shearing along a slip surface 110
5.9.2 Three-dimensional effects 118
5.9.3 Stability during construction 119
5.9.4 Relation between excavation depth and slope angle 120
5.9.5 Vertical equilibrium and uplift 123
5.9.6 Squeezing 124
5.10 Calculation methods to determine forces on piles 127
5.10.1 Piles under horizontal load from moving soil 128
5.10.2 Negative skin friction 129
5.11 Aspects of dynamics 130

6 FILL MATERIALS 134
6.1 Introduction 134
6.2 Primary materials 136
6.2.1 Sand 140
6.2.2 Clay for fills 142
6.2.3 Clay as cover layer 143
6.2.4 Loam 146
6.2.5 Boulder clay 147
6.3 Secondary materials 148
6.3.1 Euroclay 149
6.3.2 Granulates 150
6.3.3 Screen sand 151
6.3.4 Refuse incineration plant slags (AVI slags) 152
6.3.5 Aerated slags 153
6.4 Lightweight materials 153
6.4.1 Volcanic tuff sand ('Flugsand') 154
6.4.2 Natural materials of vegetable origin 155
6.4.3 PS-rigid foam 155
6.4.4 Aerated concrete 158
6.4.5 Expanded clay solid particles 160

7 CONSTRUCTION METHODS 161
7.1 Introduction 161
7.2 The construction of earth fills 161
7.2.1 Phased filling 161
7.2.2 Displacing 163
7.2.3 Cunettes 164
7.2.4 Shoulders 165
7.3 Techniques for accelerating consolidation 165
7.3.1 Horizontal drainage 165
7.3.2 Vertical drainage 166
7.3.3 Vacuum consolidation 172
7.4 Techniques for limiting deformations 176
7.4.1 Columns formed in the ground 176
7.4.2 Load relief structure 186
7.4.3 Geosynthetics 187
7.4.4 Reinforced earth 194

7.5 Comparison of construction methods 195
7.5.1 List of variants and calculations 195
7.5.2 Multi criteria analysis 198
7.5.3 Cost of variants 199
7.5.4 Weighing of variants 200
7.5.5 Example 200

8 CONSTRUCTION 203
8.1 Introduction 203
8.2 Earth moving 203
8.2.1 Excavation 204
8.2.2 Transport 204
8.2.3 Filling 204
8.2.4 Finishing 205
8.2.5 Bulking 205
8.3 Construction monitoring 207
8.3.1 Construction rate 207
8.3.2 Measurement during construction 208
8.3.3 Deformation measurement equipment 208
8.3.4 Planned measurement programme 215
8.3.5 Division of tasks 217
8.3.6 Interpretation of water pressure measurements 217
8.3.7 Settlement control 220
8.3.8 Stability control 220
8.3.9 Corrective measures 229
8.4 Cases of damage 231
8.4.1 Assessment of construction damage 231
8.4.2 Damage when constructing a dyke 235
8.4.3 Damage when constructing a noise barrier 237
8.4.4 Damage with site excavation 239

9 MAINTENANCE AND MANAGEMENT ASPECTS 242
9.1 Introduction 242
9.2 Place of management in the design process 242
9.3 Design types and maintenance plan 245
9.4 Influence on the design 247
9.5 Financing 250

APPENDIX A: CORRELATIONS 253
A1 Determining unit weight and water content via correlations 254
A1.1 Interrelationship between unit weight and water content 254
A1.2 Unit weight and water content based on soil type classification 254
A2 Determination of strength parameters via correlations 257
A2.1 Strength parameters based on normal cone penetration tests 257
A2.2 Strength parameters from friction cone tests 258
A2.3 Strength parameters based on piezocone tests 259
A2.4 Strength parameters based on pressure meter tests 259
A2.5 Strength parameters based on Atterberg consistency limits 259
A2.6 Strength parameters based on consistency 261
A2.7 Strength parameters based on hardness classification 261
A3 Determination of deformation parameters via correlations 262
A3.1 Interrelationship between deformation parameters 263

A3.2 Deformation parameters based on unit weight and water content 268
A3.3 Deformation parameters based on normal static cone penetration tests 272
A3.4 Deformation parameters based on pressure meter tests 275
A3.5 Deformation parameters based on the Atterberg limits 276
A4 Determination of permeability and degree of consolidation via correlations 276
A5 Determination of the 'low bearing capacity and highly compressible' concept via correlations 278

APPENDIX B: CHECKING OF COMPUTER SOFTWARE 280
B1 Introduction 280
B2 Exact solutions 280
B2.1 Stress distribution 281
B2.2 Total settlements 281
B2.3 Settlement as a function of time 283
B2.4 One-dimensional consolidation 283
B2.5 Two-dimensional consolidation 284
B2.6 Macrostability 285
B2.7 'Squeezing' 286
B3 Representative geometries and parameters 288
B3.1 Basic geometries 289
B3.2 Slope geometries 289
B3.3 Parameters for basic and slope geometries 291
B4 Calculations based on analytical principles 293
B4.1 Stress distribution 295
B4.2 Total settlement 295
B4.3 Settlement as a function of time 295
B4.4 One-dimensional consolidation 295
B4.5 Macrostability 296
B5 Calculations based on the finite-element method 296
B5.1 Stress distribution 298
B5.2 One-dimensional consolidation 298
B5.3 Two-dimensional consolidation 299
B5.4 Macrostability 300

APPENDIX C: VALIDATION OF CALCULATION METHODS 300

APPENDIX C: VALIDATION OF CALCULATION METHODS 301
C1 Introduction 301
C2 Project 1: Provincial road 301
C2.1 Project description 301
C2.2 Design profile 301
C2.3 Validation calculations 301
C3 Project 2: Loss of overall stability of a river dike 302
C3.1 Project description 304
C3.2 Geotechnical investigation 304
C3.3 Schematisation of the geotechnical profile 305
C3.4 Analytical validation calculation 306
C3.5 Validation calculation by a finite-element method 307
C3.6 Validation assessment 307
C4 Recommendations arising from the validation 308
309

APPENDIX D: PREDICTION AND MEASUREMENT OF SETTLEMENTS AND PORE WATER PRESSURES 310
D1 Settlement and water pressure prediction 310
D2 Interpreting settlement plate and piezometer readings 313

APPENDIX E: 'STATE OF THE ART' ON THE MECHANICAL BEHAVIOUR OF CLAY AND PEAT 317
E1 Introduction 317
E2 Behaviour independent of time 317
E2.1 Terzaghi one-dimensional formula 318
E2.2 Large deformations 319
E2.3 Unique correlation between specific volume and vertical stress 320
E2.4 Multi-dimensional behaviour; the Cam-clay model 323
E2.5 K_0-value 329
E3 Time-dependent behaviour 329
E3.1 One-dimensional creep 329
E3.2 Ageing 331
E3.3 Phased loading 331
E3.4 'Koppejan' method 332
E3.5 Multi-dimensional creep 333
E3.6 Consolidation 338
E4 Anisotropy 339
E5 The finite-element method 340
E6 SHANSEP and the simple shear-apparatus 341
E6.1 SHANSEP model 341
E6.2 Simple shear-apparatus 343
E7 Peat classification 345
E7.1 Relationship between classification properties and mechanical properties 345
E7.2 Classification parameters to be determined 346
E7.3 Standards and methods 346
E8 Aspects requiring further investigation 349

APPENDIX F: EXAMPLES OF MANUAL CALCULATIONS 351
F1 Settlements 351
F1.1 Graphical settlement calculation using the 'Koppejan' method 351
F2 Macrostability 353
F2.1 Stability calculation using straight slip surfaces 353
F2.2 Stability calculation with circular slip surfaces 356
F2.3 Stability calculation with random slip surfaces 360

APPENDIX G: REFERENCES 365

GLOSSARY WITH PAGE REFERENCES 381

ADVERTISEMENTS 389
