Foundations and Slopes

An introduction to applications of critical state soil mechanics

J. H. ATKINSON

Reader in Soil Mechanics and Head of the Division of Geotechnical Engineering, The City University, London

CONTENTS

Consulting editor's foreword ix

Preface xi

A note on units xiii

Glossary of symbols xiv

1. Stress, Strain, Elasticity, and Plasticity

1.1	Introduction	1
1.2	Stress, strain, and effective stress	2
1.3	Analysis of deformation and strain	4
1.4	Analysis of states of stress	11
1.5	Relationships between stress and strain	14
1.6	Elastic and plastic deformations	16
1.7	Yielding, hardening, and plastic flow	17
1.8	Ideal elastic behaviour	22
1.9	Elasto-plastic behaviour	23
1.10	Equilibrium and compatibility	25
1.11	Relationships between stress and strain for plane strain	27
	References	29

2. An Introduction to the Mechanics of Soils

2.1	Introduction	30
2.2	Drained and undrained loading	31
2.3	The state boundary surface	32
2.4	Yielding and hardening	42
2.5	Failure of soil	48
2.6	Elastic stress–strain relationships	53
2.7	Elasto-plastic stress–strain relationships	56
2.8	Failure and plastic flow at the critical state	59
2.9	Residual strength	66
2.10	Anisotropic compression	68
2.11	Summary	70
	References	72
	Worked examples	72

3. Natural Soils in Foundations and Slopes

3.1	Introduction	8
3.2	Formation of natural soils	8
3.3	States of stress in the ground	8
3.4	Overconsolidation of natural soils	9
3.5	Profiles of water content and strength for natural soils	9
3.6	Loading of soil in foundations and slopes	9
3.7	Investigations, sampling, and testing	9
3.8	Analysis of soil structures	10
3.9	Selection of strength parameters for design	10
3.10	Factor of safety	10
	References	10
	Worked examples	10

4. Theorems of Plastic Collapse and their Application to Soil Structures

4.1	Introduction	10
4.2	Principle of virtual work	10
4.3	Theorems of plastic collapse	111
4.4	Use of bound theorems for the collapse of a beam	114
4.5	Failure criteria for soils	116
4.6	Mechanisms for plane plastic collapse	118
4.7	Increments of work done during plastic collapse	122
4.8	Displacement diagrams	125
4.9	Slip fans	126
4.10	Discontinuous stress states	130
4.11	Stress fans	135
4.12	α and β discontinuities	141
4.13	Summary	143
	References	145

5. Undrained Stability of Soil Structures

5.1	Introduction	146
5.2	Bound calculations for undrained loading	148
5.3	Undrained stability of cuts and slopes	149
5.4	Undrained stability of a smooth retaining wall	158
5.5	Undrained stability of a foundation	164
5.6	Undrained stability of a rough retaining wall	177
5.7	Effect of external water pressures	180
5.8	Discussion	185
	References	185
	Worked examples	185

6. Drained Stability of Soil Structures

83	*6.1*	Introduction	194
83	*6.2*	Bound calculations for drained loading	195
85	*6.3*	Stability of slopes in dry soil	197
90	*6.4*	Drained stability of a smooth wall	202
91	*6.5*	Drained stability of a foundation	208
95	*6.6*	Bound calculations for saturated soil	225
99	*6.7*	Drained stability of a rough retaining wall	232
101	*6.8*	Discussion	236
104		References	237
105		Worked examples	237
106			
106			

7. Associated Fields and Slip Line Methods

	7.1	Introduction	247
109	*7.2*	Relationships between stress and strain in a perfectly plastic material at failure	247
109	*7.3*	Stress field calculations for undrained loading	253
111	*7.4*	Stress field calculations for drained loading	256
114	*7.5*	Displacement field calculations	258
116	*7.6*	Associated fields calculations	261
118	*7.7*	Slip line sketching for undrained loading	262
122	*7.8*	Slip line solutions for undrained loading	264
125	*7.9*	Slip line sketching for drained loading	269
126	*7.10*	Slip line solutions for drained loading	272
130	*7.11*	Discussion	278
135		References	279
141		Worked examples	279
143			
145			

8. The Limit Equilibrium Method

	8.1	Introduction	286
146	*8.2*	The theory of the limit equilibrium method	286
148	*8.3*	Limit equilibrium solutions for retaining walls	287
149	*8.4*	Graphical methods for limit equilibrium calculations	291
158	*8.5*	The slip circle method for undrained loading	297
164	*8.6*	The slip circle method for drained loading – the method of slices	301
177	*8.7*	General limit equilibrium solutions	307
180	*8.8*	Factor of safety	309
185	*8.9*	Discussion	310
185		References	310
185		Worked examples	311

9. Routine Methods for Stability Calculations

9.1 Introduction 315
9.2 Bearing capacity factors for undrained loading 320
9.3 Stability numbers for undrained loading 322
9.4 Earth pressure coefficients for undrained loading 324
9.5 Bearing capacity factors for drained loading 325
9.6 Stability numbers for drained loading 328
9.7 Earth pressure coefficients for drained loading 329
9.8 Discussion 331
References 331
Worked examples 331

10. Settlement of Foundations

10.1 Introduction 335
10.2 Drained and undrained loading of foundations 335
10.3 States of stress in elastic soil 339
10.4 Standard solutions for foundations on elastic soil 343
10.5 Influence factors for stress and displacement 349
10.6 One-dimensional loading of elastic soil 354
10.7 Consolidation settlements 355
10.8 Rate of consolidation of foundations 359
10.9 Stress path methods 363
References 365
Worked examples 366

11. Concluding Remarks 372
