Preface	XIII
A note to the reader	XV
Thanks	XVII

FROM THE RESEARCH TO ADECO-RS

1 The dynamics of tunnel advance	3
1.1 The basic concepts	3
1.2 The medium	7
1.3 The action	9
1.4 The reaction	11
2 The deformation response of the medium to excavation	15
2.1 The experimental and theoretical research	15
2.1.1 The first research stage	17
2.1.2 The second research stage	19
2.1.2.1 The example of the Frejus motorway tunnel (1975) ..	21
2.1.2.2 The example of the "Santo Stefano" tunnel (1984)	25
2.1.2.3 The S. Elia tunnel (1985)	29
2.1.2.4 The example of the "Tasso" tunnel (1988)	31
2.1.2.5 The results of the second research stage	33
2.1.3 The third research stage	35
2.1.3.1 The Vasto tunnel (1991)	45
2.1.3.1.1 A brief history of the excavation	45
2.1.3.1.2 The survey phase	47
2.1.3.1.3 The diagnosis phase	49
2.1.3.1.4 Assessment of the stress-strain behaviour	49
2.1.3.1.5 The therapy phase	49
2.1.3.1.6 The operational phase	55
2.1.3.1.7 The monitoring phase during construction	57
2.1.3.2 Results of the third research stage	61
2.2 The advance core as a stabilisation instrument	65
2.3 The advance core as a point of reference for tunnel specifications	66

3 Analysis of the deformation response according to the ADECO-RS approach	69
3.1 Experimental and theoretical studies	69
3.1.1 Full scale experimentation	71
3.1.2 Laboratory experimentation	77
3.2 Numerical analyses	83
3.2.1 Studies using analytical approaches	83
3.2.2 Studies using numerical approaches on axial symmetrical models	85
3.2.3 Studies using numerical approaches on 3D models	89
3.3 Results of the experimental and theoretical analyses of the deformation response	91
4 Control of the deformation response according to the ADECO-RS approach	93
4.1 Control ahead of the face	95
4.2 Control in the tunnel back from the face	95
5 The analysis of controlled deformation in rocks and soils	105
5.1 Development of the new approach	105
5.1.1 Conceptual framework according to the ADECO-RS approach	107
5.1.1.1 Category A	111
5.1.1.2 Category B	111
5.1.1.3 Category C	113
5.1.2 The different stages of the ADECO-RS approach	115
THE DESIGN STAGE	
6 The survey phase	121
6.1 Introduction	121
6.1.1 The basic concepts of the survey phase	121
6.1.2 The survey phase for conventional excavation	123
6.1.2.1 The geomorphological and hydrogeological characteristics of the area	125
6.1.2.2 Location and definition of the terrain through which the underground alignment passes	127
6.1.2.3 Tectonics, geological structure and the stress state of the rock mass	129
6.1.2.4 Hydrogeological regime of the rock mass	133
6.1.2.5 Geomechanical characteristics of the materials	133
6.1.3 The survey phase for TBM excavation	139
6.1.4 Geological surveys for excavation with preliminary pilot tunnel	141
6.1.5 Final considerations	145

7 The diagnosis phase	153
7.1 Background	153
7.2 The basic concepts of the diagnosis stage	153
7.3 Identification of sections with uniform stress-strain behaviour	155
7.4 Calculation methods for predicting the behaviour category	159
7.5 Assessing the development of the deformation response	165
7.6 Portals	167
7.6.1 Lithology, morphology, tectonics and structure of the slope to be entered	169
7.6.2 Hydrology, pre-existing buildings and structures and environmental constraints	169
7.6.3 Geomechanical characteristics of the ground	171
7.6.4 Forecasting the deformation behaviour of the slope	171
7.7 Final considerations	173
8 The therapy phase	175
8.1 Background	175
8.2 Basic concepts of the therapy phase	177
8.3 Excavation systems	183
8.4 Mechanised or conventional excavation?	185
8.5 Tunnel boring machines in relation to the confinement action they exert	191
8.6 Design using conventional excavation	195
8.7 Stabilisation intervention	199
8.7.1 Preconfinement intervention	205
8.7.2 Confinement intervention	207
8.7.3 Presupport and support intervention	209
8.8 Composition of typical longitudinal and cross sections	209
8.9 Construction variabilities	217
8.10 The dimensions and verification of tunnel section types	219
8.10.1 Solid load calculation methods	221
8.10.2 Plasticised ring calculation methods	223
8.11 Particular aspects of the therapy phase	225
8.11.1 Tunnels under the water table	225
8.11.2 Adjacent tunnels	231
8.11.3 Tunnels with two faces approaching each other	231
8.11.4 Portals	235
8.12 Final considerations	237
THE CONSTRUCTION STAGE	
9 The operational phase	241
9.1 Background	241
9.2 The basic concepts of the operational phase	241
9.3 Excavation	243

9.4	Cavity preconfinement intervention	247
9.4.1	Cavity preconfinement by means of full face mechanical precutting	247
9.4.2	Cavity preconfinement using pretunnel technology	257
9.4.3	Preconfinement of the tunnel after strengthening the core-face with fibre glass reinforcement	267
9.4.4	Preconfinement of the tunnel by means of truncated cone 'umbrellas' formed by sub horizontal columns of ground side by side improved by jet-grouting	279
9.4.5	Preconfinement of the tunnel by means of truncated cone 'umbrellas' of ground improved by means of conventional grouting	289
9.4.6	Preconfinement of the tunnel by means of truncated cone 'umbrellas' of drainage pipes ahead of the face	295
9.5	Cavity confinement intervention	301
9.5.1	Confinement of the cavity by means of radial rock bolts	301
9.5.2	Cavity confinement using a preliminary lining shell of shotcrete	307
9.5.3	Confinement of the cavity by means of the tunnel invert	313
9.5.4	Confinement of the cavity by means of the final lining	315
9.6	Waterproofing	317
10	The monitoring phase	321
10.1	Background	321
10.2	Basic concepts	323
10.3	Measurement stations	325
10.3.1	Principle measurement stations	325
10.3.2	Extrusion measurement stations	329
10.3.3	Monitoring stations	331
10.3.4	Systematic measurement stations	331
10.4	The design of the system for monitoring during construction	333
10.5	Monitoring the tunnel when in service	337
10.6	The interpretation of measurements	343
10.6.1	Background	343
10.6.2	Interpretation of extrusion measurements	345
10.6.3	The interpretation of convergence measurements	349
10.7	Back-analysis procedures	355
10.7.1	Fine tuning of the design during construction of the tunnel beneath the Mugello international motor racing track with a shallow overburden	357
10.7.1.1	The survey phase	357
10.7.1.2	The diagnosis phase	359
10.7.1.3	The therapy phase	361
10.7.1.4	The monitoring programme	361
10.7.1.5	Final calibration of the design based on monitoring feedback	363
10.7.1.6	The operational phase	367
10.7.1.7	The monitoring phase	367

Final considerations	371
APPENDICES	
Introduction to the appendices	383
Appendix A The design and construction of tunnels for the new Rome-Naples high speed/capacity railway line ..	385
Appendix B The design and construction of tunnels for the new Bologna-Florence high speed/capacity railway line	413
Appendix C The Tartaiguille tunnel	453
Appendix D Cellular arch technology	471
Appendix E Artificial Ground Overburdens (A.G.O.)	493
Appendix F Portals in difficult ground	509
Appendix G Widening road, motorway and railway tunnels without interrupting use	539
Glossary	559
Bibliography	567
Contents of the special focus boxes	573
