CSIC Cambridge Centre for Smart Infrastructure & Construction

Distributed Fibre Optic Strain Sensing for Monitoring Civil Infrastructure

A practical guide

Cedric Kechavarzi, Kenichi Soga, Nicholas de Battista, Loizos Pelecanos, Mohammed Elshafie and Robert Mair

Contents	Acknowledgements About the authors Notation	ix xi xv
	Introduction References	1 6
	Part A. General concepts	9
01	 Physical principles of fibre optic strain sensing 1.1. Basics of light propagation in optical fibres 1.2. Distributed Brillouin sensing principles References 	11 11 22 29
02	 Fibre optic strain analysers and specifications 2.1. System specifications 2.2 Commercial Brillouin analysers 2.3. Basic Brillouin spectrum analysers operation References 	31 38 47 52
	Part B. Practical considerations	53
03	 DFOS hardware and testing equipment 3.1. Strain and temperature compensation cable characteristics 3.2. Splices 3.3 Connectors 3.4. Testing and integrity checking equipment References 	55 63 69 71 82
04	 Installation and operation of DFOS systems 4.1. Preparation of fibre optic cables for a DFOS system 4.2. Installation of a DFOS system 4.3. Taking measurements from a DFOS system 4.4. Health and safety considerations Reference 	83 90 99 101 104
	Part C. Data processing, analysis and interpretation	105
05	 Calculating strain from Brillouin frequency data 5.1. Influence of strain and temperature on Brillouin frequency shift 5.2. Thermal expansion of structure 	107 107 108
	5.3. Temperature compensated strain5.4 Associated data processing routines and implementation into coffuse	109
