PREFACE

PREFACE TO COMPUTER MATERIALS

1 APPROACHING THE SUBSURFACE

What Are the Options?, 1 Some Fundamental Considerations, 2 Defining Objectives, 3 Limitations, 4 The Advantage of Multiple Methods, 5

2

SEISMIC EXPLORATION: FUNDAMENTAL CONSIDERATIONS 7

Contents

Seismic Waves and Wave Propagation 7

Wave Terminology, 9 Elastic Coefficients, 11 Seismic Waves, 14 Seismic Wave Velocities, 17 Ray Patter in Layered Materials.

Hangens Principol, 20 Primus 2 Principle, 20 Refrection, 21 Snell'Y Lan, 23 Critical Softwarfon, 28 Diffraction, 30 Note arrival, at the Stay

bas no itsugent A avev

Spherreal Spreading, 3 Absorption, 37 Energy Partitioning, 3 Additional Pachers, 40

Friergy Sources 42

Source Bypes, 42 Source Considerations, 4

> eisitute Equipment – Signal Denettion, 15 Suprol Conditioning

> > xvii

xxi

57

Ray Paths in Layered Materials 19

Huygens' Principle, 20 Fermat's Principle, 20 Reflection, 21 Refraction, 23 Snell's Law, 25 Critical Refraction, 28 Diffraction, 30 Wave Arrivals at the Surface, 31

Wave Attenuation and Amplitude 35

Spherical Spreading, 35 Absorption, 37 Energy Partitioning, 38 Additional Factors, 40

Energy Sources 42

Source Types, 42 Source Considerations, 44

Seismic Equipment 45

Signal Detection, 45 Signal Conditioning, 49 Signal Recording, 51

Summary 54

Problems 54

SEISMIC EXPLORATION: THE REFRACTION METHOD

A Homogeneous Subsurface 57

A Single Subsurface Interface 59

Derivation of Travel-Time Equation, 60 Analysis of Arrival Times, 62 Determining Thickness, 64 Crossover Distance, 64 Critical Distance, 65 Constructing a Travel-Time Curve from a Field Seismogram, 67 Using RefractModel and RefractSolve, 68 The Mohorovičić Discontinuity, 70

viii

Two Horizontal Interfaces 71

Derivation of a Travel-Time Equation, 72 Determining Thickness, 74 Critical Distance, 75 Analyzing a Second Field Seismogram, 78

Multiple Interfaces 79

Dipping Interfaces 80

Analyzing the Problem, 80 Derivation of a Travel-Time Equation, 86 Determining Thickness, 88

Multiple Dipping Interfaces 89

Time Equation, 89 Analyzing Field Seismograms, 91

The Nomideal Subsurface 95

Fidden Zones: The Low-Velocity Layer, 95 Fidden Zones: The Thin Layer, 99 Laterally Varying Velocity, 101 Interface Discontinuities, 104

The Delay-Time Method 107

Other Methods 113

Wavefront Method, 113 Ray Tracing and the Generalized Reciprocal Method, 114

Field Procedures 116

Size Selection and Planning Considerations, 116 Equipment Considerations, 117 Geophone-Spread Geometries and Placements, 117 Corrections to Data, 120

Automications Using Seismic Refraction 122

Massachusetts, 122 Southeastern New Hampshire, 124 Maste-Disposal Site, 124 Maricopa Area, Arizona, 124

134

SEISMIC EXPLORATION: THE REFLECTION METHOD

A Single Subsurface Interface 135

X

Using ReflectModel, 135 Derivation of a Travel-Time Equation, 136 Analysis of Arrival Times, 140 Normal Move-Out, 144 Determining Velocity and Thickness, 147 Applying the x²-t² Method to a Field Seismogram, 149

Multiple Horizontal Interfaces 152

The Dix Equation, 153 Determining Velocities, 154 Determining Thickness, 157 Further Discussion of the Dix Method, 158 Analyzing a Field Seismogram Containing Multiple Reflections, 164

Dipping Interface 165

Derivation of Travel-Time Equation, 166 Determining Dip, Thickness, and Velocity, 171 Determining Dip, Thickness, and Velocity—Another Approach, 172 A Return to Normal Move-Out, 174 Determining Dip, Thickness, and Velocity—Yet Another Approach, 178

Acquiring and Recognizing Reflections from Shallow Interfaces 181

The Optimum Window, 182 Multiple Reflections, 187 Diffractions, 191

Common Field Procedures 197

Equipment Considerations, 197 Geophone Spreads, 199

Computer Processing of Reflection Data 208

The Static Correction, 208 Correcting for Normal Move-Out, 211 Stacking CDP Gathers, 217 Migration, 219 Waveform Adjustments, 222 Seismic Sections: Time Sections and Depth Sections, 223

Applying the Seismic Reflection Method 225

Whately, Massachusetts, 226 Meers Fault, Oklahoma, 226 Cavity Detection, 228 Other Applications, 230

Problems 230

6 EXPLORATION USING GRAVITY

Fundamental Relationships 318

Gravitational Acceleration, 318

Measuring Gravity 319

Relative Measurements Using a Pendulum, 319 Relative Measurements Using a Gravimeter, 320 Absolute Measurements, 322 International Gravity Standardization Net 1971 (IGSN71), 323

Adjusting Observed Gravity 323

Variation in g as a Function of Latitude, 324 Correcting for the Latitude Effect, 324 Elevation Correction 1: The Free-Air Correction, 326 Elevation Correction 2: The Bouguer Correction, 327 Elevation Correction 3: The Terrain Correction, 331 The Isostatic Anomaly, 336

Basic Field Procedures 336

Drift and Tidal Effects, 336 Establishing Base Stations, 338

Determining Elevations, 340 Determining Horizontal Position, 341 Selecting a Reduction Density, 341 Survey Procedure, 342

Gravity Effects of Simple Geometric Shapes

Rock Densities, 344 Gravity Effect of a Sphere, 345 Gravity Effect of a Horizontal Cylinder, 347 Gravity Effect of a Vertical Cylinder, 350 Gravity Effect of an Inclined Rod, 353 Gravity Effect of a Horizontal Sheet, 355 Using GravModel, 361

Analyzing Anomalies 362

Regionals and Residuals, 363 Trend Surfaces, 366 Upward and Downward Continuation, 366 Second Derivatives, 370 Filtering, 372

Gravity Interpretation 372

Half-Maximum Technique, 372 Second-Derivative Techniques, 374 Revisiting Some Bouguer Anomaly Values, 376

Applications of the Gravity Method 377

Bedrock Depths, 377 Subsurface Voids, 378 Landfill Geometry, 379

Problems 381

The point is based on an exploration geophysics course that I have bright for 15 for it is directed at advanced undergraduates who typically are majoring to geolcourses the text who is appropriate for geology geoducte students and students of a other classifings (hydrology, englescong, sucharology) who require some one of prophysical methods.

where in the successing interest in the shellow substituted, I force on methods and when are explorated for the shellow target. Examples, illustrations, are lications are set all emphasize shallow exploration, as constantly with the worst typical areas of the contains material areas over directed towing targets a depth.

sound not for exploring the phalaes substitute. Seismic methods are discussed out inf chapter devoted to some basics propagation of clastic waves, instrumenwith the chapter devoted to some basics propagation of clastic waves, instrumenwith the seismology in presented, as this still is the most concrum method for studies work. The longest element is the book concentrates on reflection of the technique is just beginning to find applications in stallow work, holds with each in distlow applications are not covered in existing texts. Element al methods follow relation controls, its does often are used in conjunction with were for investigations of shallow depths. The next to lost chapter in the text is both to the station of a constrainty most for shallow servers, graving coption of the section of the to offer in obtaining much actual in conjunction of the shallow investigations are sold to offer in obtaining much actual in conjunction of the shallow induces as constrainty most for shallow servers, graving coption of the station of the text in the text is
