CONTENTS

Preface VII

Part I: Tectono-mechanical models

I.1. INTRODUCTION 1

1. Geomechanics in Structural Geology 1
2. Tectonic faulting – basic phenomena 3
3. The plasticity approach 8

I.2. GENERAL FAULT FEATURES 11

1. Energy dissipation and the sense of movement 11
2. The onset of faulting 12
3. Orientation of fault planes 16
4. Curved faults 24
5. The segmentary development of faults 43
6. Antithetic faults 47
7. The tectonic significance of shear softening 64
8. Redistribution of stresses, precursory and secondary faults 71
9. Model experiments 88
Notes 90

I.3. EXTENSIONAL FAULTING 95

1. Gravitational faulting on delta slopes 96
2. Overburden extension by horizontal stretching of ductile base 115
3. Horizontal extension and subsidence 127
4. Updoming 128
5. Oblique slip 130
Notes 131

I.4. WRENCH FAULTING 135

1. Mechanical classification 135
2. Wrench zone above a single planar basement fault with pure strike-slip 137
3. Faulting above a wide zone of basement wrenching 144
4. Oblique slip on single basement fault – 'Tulip' vs. 'Palm-tree' structures 147
5. Termination of wrench faults 149
6. Lateral offsets of grabens and wrench faults 152

I.5. THRUSTING 157

1. Thin-skinned and thick-skinned thrusting 157
2. Mechanics of sedimentary thrust belts 159
3. Mechanics of a thrust sheet 169
Notes 185

Part II: Basic concepts

II.1. STRESS 191

1. Definition and units 191
2. Stress vectors and tensors 192
3. Invariant properties 198
4. Sign convention 202
5. Stress fields 202

II.2. STRESS EQUILIBRIUM 207

1. Static equilibrium in the 'small' 207
2. Equilibrium equations in 'effective' stresses 216
3. Static equilibrium in the 'large' 219
Notes 224

II.3. STRESSES IN POROUS ROCKS 227

1. Micro- and macro-scale 227
2. Fluid and solid stresses 228
Notes 232

II.4. THE STRESS CIRCLE 233

1. Derivation 233
2. Properties of Mohr's stress circle 236
3. Applications 240
4. Three-dimensional state of stress 243

II.5. STRAIN 245

1. Infinitesimal strain 245
2. Displacements and strains 248
3. Plane strain 254
4. Strain rates 262
5. Small vs. large rock strains 262
Notes 263

II.6. PORO-ELASTICITY 265

1. Elastic straining of porous material without change in pore pressure 265
2. Elastic straining with change in pore pressure 266
3. The poro-elastic equations in terms of effective stresses 270
4. The application of the poro-elastic stress/strain relations 271
Notes 281

II.7. PLASTICITY OF ROCKS 285

1. Idealised materials 285
2. Frictional or 'cataclastic' plasticity 290
3. Coulomb's limit condition 297
4. 'Coulomb slips' and the 'Double-gliding' model 305
5. The elastic/frictional plastic material 317
6. Continuous and discontinuous slip surfaces 326
7. The elastic/frictional plastic material with strain hardening and softening 330
8. Stability and instability of elastics/plastic deformation 337
9. Applicability and future improvements 343
Notes 347

II.8. WORK 353

1. The concept 353
2. Work and energy 356
3. Applications 357
4. Work in straining deformable material 361
Notes 364

II.9. BUOYANCY IN POROUS ROCKS 367

1. Preliminaries 367
2. Fluid-filled porous rocks 370
3. Migration and trapping of hydrocarbons 373
Notes 377

II.10. FLOW THROUGH POROUS ROCKS 379

1. Pressure and flow 379
2. Darcy's flow law 380
3. Theoretical foundation 386
Notes 388
