Preface ix

1 Introduction to modelling 1
1.1 Introduction . . . 1
1.2 Empirical models . . . 1
1.2.1 Vane strength correction . . . 2
1.2.2 Consolidation settlement . . . 4
1.2.3 Cone penetration test and settlement of footings on sand 8
1.2.4 Pressuremeter . . . 11
1.3 Theoretical models . . . 14
1.3.1 Steady seepage . . . 14
1.4 Numerical modelling . . . 17
1.5 Constitutive modelling . . . 18
1.6 Physical models . . . 20
1.6.1 Physical models: full-scale . . . 21
1.6.2 Physical models: small-scale . . . 24
1.7 Geological model . . . 26
1.8 Classification model . . . 28
1.9 Conclusion . . . 32

2 Characteristics of soil behaviour 35
2.1 Introduction . . . 35
2.2 Particle-continuum duality . . . 36
2.3 Laboratory element testing . . . 44
2.4 Stress and strain variables . . . 50
2.5 Stiffness . . . 61
2.5.1 Nonlinearity: secant and tangent stiffness . . . 61
2.5.2 Stiffness and strain measurement . . . 67
2.5.3 Stiffness and history: stress response envelopes . . . 69
2.5.4 Anisotropy of stiffness . . . 75
2.6 Dilatancy . . . 82
2.6.1 Critical states: state variable . . . 86
2.6.2 Pore pressure parameter . . . 88
2.7 Strength . . . 89

3 Constitutive modelling **97**
3.1 Introduction . . . 97
3.2 Elastic models . . . 98
3.2.1 Conventional drained triaxial compression test . . . 103
3.2.2 Conventional undrained triaxial compression test . . . 103
3.2.3 Measurement of elastic parameters with different devices . 105
3.2.4 Anisotropy . . . 107
3.2.5 Nonlinearity . . . 112
3.2.6 Heterogeneity . . . 116
3.3 Elastic-perfectly plastic models . . . 117
3.3.1 General elastic-perfectly plastic model . . . 119
3.3.2 A digression: collapse of portal frame . . . 120
3.3.3 General elastic-perfectly plastic model (continued) . . . 123
3.3.4 Elastic-perfectly plastic Mohr-Coulomb model . . . 124
3.4 Elastic-hardening plastic models . . . 133
3.4.1 Extended Mohr-Coulomb model . . . 137
3.4.2 Cam clay . . . 153
3.5 Modelling non-monotonic loading . . . 166
3.6 Modelling cementation and structure . . . 168
3.7 Modelling rate effects . . . 169
3.8 Design of programmes of laboratory tests . . . 172
3.9 Selection of soil parameters: calibration of models . . . 178

4 Numerical modelling **181**
4.1 Introduction . . . 181
4.2 Field problems . . . 182
4.2.1 One-dimensional problem . . . 182
4.2.2 Two-dimensional problem . . . 185
4.3 One-dimensional finite elements . . . 187
4.4 Two-dimensional finite elements . . . 190
4.4.1 Example: Constant strain triangle . . . 192
4.4.2 Example: Linear strain triangle . . . 193
4.4.3 Quadrilateral elements . . . 195
4.4.4 Comparison of elements . . . 197
4.5 Integration—Gauss points . . . 199
4.5.1 Reduced integration . . . 200
4.6 Nodal forces and external loads . . . 202
4.7 Dynamic analysis . . . 204
4.8 Finite differences . . . 206
4.9 Solution schemes . . . 211
4.10 Conduct of numerical modelling . . . 217
4.10.1 Verification: Is the program doing what it claims to be doing? . . . 218
4.10.2 Are we getting the answers that we think we are getting? 220
4.10.3 Validation: Are we getting the answers that we need? . . 222
4.10.4 Exercise in numerical modelling: FLAC analysis of footing on Mohr-Coulomb soil . . . 225

4.11 Closure 231

5 Physical modelling **233**
5.1 Introduction 233
5.2 Dimensional analysis 234
5.2.1 Slope in cohesive soil 234
5.2.2 Fall-cone 237
5.2.3 Consolidation 237
5.2.4 Fluid drag 238
5.2.5 Settlement of a footing 240
5.2.6 Bearing capacity of a footing 243
5.2.7 Soil nonlinearity 245
5.3 Scaling laws revisited 246
5.3.1 Length 248
5.3.2 Density 248
5.3.3 Acceleration 249
5.3.4 Stiffness 250
5.3.5 Strain 251
5.3.6 Displacement 252
5.3.7 Permeability 253
5.3.8 Hydraulic gradient 254
5.3.9 Time scales 255
5.3.10 Shear wave velocity 257
5.4 Soil-structure interaction 258
5.4.1 Footing 258
5.4.2 Pile under lateral loading 259
5.4.3 Flexible retaining wall 262
5.4.4 Buried flexible culvert 263
5.4.5 Piles under axial load 265
5.4.6 Dynamic soil-structure interaction 266
5.5 Single gravity modelling 267

6 Centrifuge modelling **269**
6.1 Introduction 269
6.2 Mechanics of centrifuge modelling 269
6.3 Centrifuges 274
6.4 Model preparation 281
6.5 Geotechnical processes 284
6.6 Pore fluid 294
6.7 Site investigation 296
6.8 Instrumentation 299
6.9 Modelling and testing 304
6.10 Closure 307

7 Theoretical modelling **309**
7.1 Introduction . . . 309
7.2 Elastic stress distributions . . . 310
7.3 Plastic failure analysis . . . 314
7.3.1 Bound theorems . . . 315
7.3.2 Structural example . . . 315
7.3.3 Continuum problems—Mohr's circle . . . 318
7.3.4 Bearing capacity of cohesive soil . . . 319
7.3.5 Wall retaining cohesive soil . . . 331
7.3.6 Bearing capacity of frictional soil . . . 334
7.4 One-dimensional consolidation . . . 344
7.4.1 Parabolic isochrones . . . 349
7.4.2 General power law approximate solution . . . 351
7.4.3 Pore pressures for stability analysis of embankment on soft clay . . . 352
7.5 Macroelement models . . . 360
7.5.1 Box model . . . 360
7.5.2 Wall model . . . 371
7.5.3 Footing model . . . 375
7.5.4 Extended Newmark sliding block model . . . 381
7.6 Closure . . . 385

8 Soil-structure interaction **387**
8.1 Introduction . . . 387
8.2 Elastic analyses . . . 387
8.2.1 Beam on elastic foundation . . . 387
8.2.2 Pile under lateral loading . . . 393
8.2.3 Pile under axial loading . . . 394
8.2.4 Piled raft . . . 399
8.3 Serviceability calculations . . . 404
8.4 Relative foundation stiffness . . . 409
8.5 Downdrag on pile . . . 412
8.6 Settlement reducing piles . . . 417
8.7 Flexible retaining wall . . . 421
8.8 Tunnel lining . . . 429
8.9 Pile in displacing ground . . . 435
8.10 Integral bridge abutment . . . 445
8.11 Closure . . . 458

9 Envoi **459**

Bibliography **463**

Index **477**
