

DESIGN TEXTBOOKS IN CIVIL ENGINEERING: VOLUME VIII

HYDRO-ELECTRIC ENGINEERING FOR CIVIL ENGINEERS

SERGE LELIAVSKY

Ph.D., M.I.C.E., F.Am.Soc.C.E.

formerly Director, Designing Service, Reservoirs and Nile Barrages Department, Ministry of Public Works, Cairo, Chief of Designing Office, Irrigation Projects Department, Ministry of Public Works, Cairo, Professor of Irrigation Design, Royal School of Engineering, Guiza, Cairo, Head of the Bridges Department, Egyptian State Railways, Cairo, Head of the Hydraulic Section of Lock and Dam Construction Works on the Dneiper Falls, Russia

1982

LONDON NEW YORK
CHAPMAN AND HALL

CONTENTS

1. Basic Postulates of Turbine Design	<i>page</i> 1
<i>Section I. THE MAIN EQUATIONS</i>	1
<i>Section II. THE SPECIFIC-SPEED CONCEPT</i>	1
2. Frequently Used Types of Turbines	4
<i>Section I. CHOICE OF TYPE</i>	4
<i>Section II. THE PELTON WHEEL</i>	14
<i>Section III. THE FRANCIS TURBINE</i>	21
<i>Section IV. THE PROPELLER TYPE</i>	25
<i>Section V. THE KAPLAN TURBINE</i>	28
3. Main Dimensions of the Turbine	37
<i>Section I. CALCULATION OF DIAMETER OF THE TURBINE</i>	37
1. General Principle of the Method	37
2. Number of Units and Point of Maximum Efficiency. Stay-vanes and Guiding Gates	39
<i>Section II. CALCULATION OF THE LEVEL OF THE TURBINE</i>	43
1. Foundation Levels	43
2. Cavitation Phenomenon, as Affecting Turbine Design	44
3. Thoma's Formula and Other Data	47
<i>Section III. CALCULATION OF THE FOUNDATION-LEVEL</i>	49
1. The Function and Importance of the Draft-tube	49
2. Recapitulation of the General Method of Procedure	51
4. Design of Power-house	53
<i>Section I. GENERAL LAY-OUT</i>	53
1. Introductory	53
2. Examples of Power-houses	53
3. Outline of a Project for a Power-house	69

<i>Section II.</i> EMPIRICAL FORMULAS AND COEFFICIENTS FOR THE PRELIMINARY DESIGN OF A POWER-HOUSE	76
<i>Section III.</i> THRUST BEARING	78
<i>Section IV.</i> APPROXIMATE ESTIMATES	80
<i>Section V.</i> REINFORCED CONCRETE DETAILS OF A POWER-HOUSE	82
5. Vibrations in Hydro-electric Installations	87
<i>Section I.</i> GENERAL THEORY	87
1. Introductory	87
2. Basic Approach	87
<i>Section II.</i> CALCULATION OF NATURAL FREQUENCIES	88
1. Elementary Case	88
2. Application to Other Simple Cases	90
<i>Section III.</i> DAMPING	91
1. Introductory	91
2. General Conclusions Concerning Free and Forced Vibrations	92
3. Three Characteristic Cases	93
4. General Formula and Comprehensive Diagram for the Amplitude of Forced Vibrations	94
5. Effect of Damping Factor	95
6. Practical Conclusions	96
<i>Section IV.</i> FORCES PRODUCING VIBRATIONS IN POWER-HOUSES	96
1. Five Types	96
2. Using Observed Frequencies for Power-house Design	100
3. Calculation of Natural Frequencies for Structural Elements	101
4. Different "Modes" of Vibration	102
<i>Section V.</i> CALCULATION OF NATURAL FREQUENCIES FOR CONTINUOUS BEAMS	103
1. General Method	103
2. Practical Application of the Method	105
3. Elastic Systems Including Frames and Slabs	107
4. The Empirical Approach	107
5. Choice of Significant Parameters	108
6. Noise Produced by Vibrations	108
<i>Section VI.</i> HYSTERESIS DAMPING CONCEPT	109
1. Introductory	109
2. Damping Capacity	111
3. Concluding Remarks	113
6. Original Tendencies in Power-house Design	114
<i>Section I.</i> MAIN NEW TYPES	114

CONTENTS

ix

1. The Standard Type	114
2. The Aim and Purpose of the New Tendencies	114
3. The Basic Principle of the Tubular Turbine	115
<i>Section II. APPLICATION OF TUBULAR TURBINES IN CONNECTION WITH TIDAL POWER DEVELOPMENTS</i>	118
<i>Section III. OTHER TYPES</i>	122
1. The Foster Creek Dam Type	122
2. Alterations in the Lay-out of Power-house, Tending to Improve River Flow	125
3. Dr. Schulz's Design	131
4. Ivantsov's Proposal	132
SUBJECT INDEX	133
AUTHOR INDEX	135
