# Contents

Preface	5	2.3.2	Determination of the grain-size distribution curve by hydrometer analysis	65	
Introduction	9	2.3.3	Theory of the hydrometry and the calibration of the hydrometer	72	
<b>Chapter 1. Soil exploration</b>	<b>11</b>	2.3.4	Determination of the clay content	74	
1.1	Survey of soil exploration methods	11	2.3.5	Determination of the combined silt and clay content	75
1.2	Guidelines for preliminary investigations; geological studies	11	2.4	Determination of the Atterberg limits	76
1.3	Soil exploration by direct methods	13	2.4.1	Liquid limit	76
1.3.1	Soil studies by pits and shafts	13	2.4.2	Plastic limit	80
1.3.2	Soil exploration by boring	15	2.4.3	Shrinkage limit	81
1.3.3	Sampling from boreholes	16	2.4.4	Saturation limit	85
1.4	Sounding	24	2.4.5	Soil consistency tests	88
1.4.1	General	24	2.4.5.1	Flattening test	88
1.4.2	Sounding by boring	24	2.4.5.2	Ball test	90
1.4.3	Impact sounding	25	2.4.5.3	Cone penetration test	91
1.4.4	Static sounding	29	2.5	Compactibility of soil (Proctor test)	92
1.4.5	Application of sounding	32	2.6	Water movement in soils	96
1.5	The extent of soil exploration and subsoil testing	33	2.6.1	Water permeability	96
			2.6.1.1	Determination of the permeability coefficient under constant head	96
<b>Chapter 2. Laboratory investigations</b>	<b>35</b>		2.6.1.2	Determination of the permeability coefficient under falling head (M.I.T. method)	102
2.1	Character and order of the examinations	35	2.6.1.3	Determination of the permeability coefficient under falling head for slightly cohesive soils	104
2.2	Characteristics for soil classification and identification	41	2.6.2	Determination of the capillary rise	108
2.2.1	Density of the solid phase	41	2.6.2.1	Determination of the capillary rise in granular soils	108
2.2.2	Water content	45	2.6.2.2	Determination of the height of the closed capillary zone	109
2.2.2.1	Experimental determination methods	45	2.6.2.3	Joint determination of the permeability and the height of the capillary rise	113
2.2.2.2	Direct determination	45	2.7	Soil strength and deformation	116
2.2.2.3	Determination of the water content by submersion	46	2.7.1	Soil compressibility	116
2.2.2.4	Determination of the water content by ignition	47	2.7.2	Soil collapse test	126
2.2.2.5	Water content determination by air pycnometer	47	2.7.3	Determination of the shear strength of granular soils by direct shear	130
2.2.3	Phase composition	48	2.7.4	Determination of the shear strength of cohesive soils by direct shear	137
2.2.3.1	Testing with a sample of regular form	49	2.7.5	Unconfined compression strength of cohesive soils	144
2.2.3.2	Testing samples of an irregular shape	51	2.7.6	Triaxial compression test (by <i>Dr. L. Varga</i> )	152
2.2.4	Primary and secondary void ratios	54	2.7.7	Tensile strength of cohesive soils	170
2.2.5	Phase composition of stabilized soils	59			
2.3	Grain-size distribution	61			
2.3.1	Determination of the grain-size distribution curve by sieving	61			

2.8	Chemical tests	172	5.2.3	Density determination with the Proctor needle	234
2.8.1	Determination of organic matter content	172	5.2.4	Water content and density determination by radioactive isotopes	235
2.8.1.1	Ignition losses	172	5.3	Determination of earthwork permeability	238
2.8.1.2	Dry oxidation	172	5.4	In-situ pore-water pressure measurement	240
2.8.1.3	Wet oxidation	174	5.5	Earthwork strength characteristics	244
2.8.2	Determination of the lime content of soils	174	5.5.1	California Bearing Ratio (CBR) test	245
2.8.3	Determination of the soluble sulfate content	175			
<b>Chapter 3. Investigation of groundwater</b>		177	References		251
3.1	Exploration of groundwater conditions	177	Author index		255
3.1.1	Introduction	177	Subject index		257
3.1.2	Groundwater pressure conditions	177	Contents of Vol. 1		259
3.1.3	Factors affecting the groundwater movement (by <i>Dr. L. Rétháti</i> )	180	Contents of Vol. 3		260
3.1.4	Determination of the standard groundwater characteristics	181	Contents of Vol. 4		260
3.1.4.1	Determination of the momentary groundwater level	182			
3.1.4.2	Determination of the water table considered as critical from construction aspects (by <i>Dr. L. Rétháti</i> )	187			
3.1.4.3	Determination of the expected maximum water table	188			
3.1.5	Groundwater flow	191			
3.2	Field determination of the coefficient of permeability	192			
3.2.1	Pumping test	192			
3.2.2	Prospecting shaft	198			
3.2.3	Examination of the coefficient of permeability by the Porchet method	199			
<b>Chapter 4. Investigation of the load bearing capacity</b>		207			
4.1	Load test	207			
4.1.1	The number of in-situ tests; determination of their location and level	207			
4.1.2	Test equipment	207			
4.1.2.1	Loading the foundation plane; rectangular loading plate	207			
4.1.2.2	Loading in a borehole	209			
4.1.3	Test preparation and performance	209			
4.1.3.1	Load test at the foundation plane	209			
4.1.3.2	Load test in a borehole	213			
4.2	Test piling	219			
4.3	Pile loading test	223			
<b>Chapter 5. Earthwork investigations</b>		229			
5.1	The importance of, and role played by, such investigations	229			
5.2	Field determination of the phase composition and the water content, respectively	230			
5.2.1	Test by drying in sand bath	230			
5.2.2	Bulk density determination by the sand-filling technique	231
