EMBANKMENTS ON SOFT CLAYS

SERGE LEROUEIL BACC (Eng.), M.Sc., Ph.D.
Associate Professor, Department of Civil Engineering,
Laval University, Quebec, Canada

JEAN-PIERRE MAGNAN Ingénieur, D.Sc.
Chief of the Geotechnical Division,
Laboratoire Central des Ponts et Chaussées, Paris

FRANÇOIS TAVENAS Ingenieur, Docteur. ing.
Professor of Civil Engineering and
Dean of the Faculty of Science, Laval University, Quebec, Canada

Translator
DAVID MUIR WOOD
Department of Civil Engineering, University of Glasgow

ELLIS HORWOOD
NEW YORK LONDON TORONTO SYDNEY TOKYO SINGAPORE

Table of contents

Preface 13

Acknowledgements 15

Chapter 1 — INTRODUCTION 17
1.1 Importance of problems associated with the construction of embankments on compressible soils 17
1.2 Distribution and particulars of compressible soil deposits around the world 22
1.2.1 Environments of sedimentation and deposits of clays 23
1.2.1.1 Marine clays 27
1.2.1.2 Lacustrine clays 28
1.2.1.3 Deltaic clays 28
1.2.1.4 Coastal and lagoon clays 29
1.2.2 Clay deposits of the world 29
1.2.2.1 North America 29
1.2.2.2 Mexico, Central America and the Caribbean 32
1.2.2.3 South America 33
1.2.2.4 Northern Europe 34
1.2.2.5 Continental Europe 35
1.2.2.6 USSR 36
1.2.2.7 Africa 37
1.2.2.8 Near East and Middle East 37
1.2.2.9 Indian subcontinent 37
1.2.2.10 South-east Asia 38
1.2.2.11 Australia and the Pacific islands 39
1.3 History of the engineering of embankments on soft soils 40
1.3.1 Initial developments 40
1.3.2 The period 1948–1970 42
1.3.3 The period from 1970 to the present 45

1.4 Cooperation between France and Quebec 48
1.5 Aims and organization of the book 49

Chapter 2 — GENERAL PRINCIPLES OF THE BEHAVIOUR OF CLAYS . . .51
2.1 Introduction 51
2.2 Physical properties of soils 51
2.2.1 Description 51
2.2.2 Classification of soils 54
2.3 Stresses; stress paths 56
2.3.1 Stresses 56
2.3.2 Representation of stress state 59
2.3.3 Stress paths 59
2.3.3.1 Lambe's representation 60
2.3.3.2 University of Cambridge representation 61
2.3.3.3 Remarks on the representation of stress paths 62
2.4 Strains; stress-strain relationships 63
2.4.1 Strains 63
2.4.2 Stress–strain relationships 63
2.4.2.1 Linear elasticity 63
2.4.2.2 Applications of linear elasticity to soils 65
2.4.2.3 Plasticity and failure 66
2.5 Yielding and critical states for ideal clays 67
2.5.1 Isotropic consolidation 67
2.5.2 Yielding of ideal clays 69
2.5.3 Critical states of ideal clays 70
2.5.4 Overconsolidated clays 71
2.5.5 Some examples of the application of the principles of yielding and critical states 71
2.5.5.1 Drained shear tests 72
2.5.5.2 Undrained shear tests 73
2.5.5.3 Anisotropic consolidation test 74
2.6 Yielding of natural clays 75
2.6.1 Determination of yield curves of natural clays 76
2.6.1.1 Experimental techniques 76
2.6.1.2 Example of the determination of a yield curve 77
2.6.1.3 Characteristics of yield curves of natural clays (the YLIGHT model) 78
2.6.2 Behaviour of clay in the normally consolidated region 80
2.7 Critical states for natural clays 82
2.7.1 Clay in a normally consolidated state 82
2.7.2 Clay in an overconsolidated state 84
2.7.3 Residual state 84
2.7.4 Shear strength of clays 84
2.8 Effects of rate and time on the behaviour of clays 85
2.8.1 Effects of ageing 85
2.8.2 Effects of rate and duration of loading 86

2.9 Structural phenomena in clays 87
2.9.1 Structure 87
2.9.2 Effects of loss of structure 89
2.9.3 Implications of the phenomena of loss of structure 89
2.9.3.1 Disturbance during *in situ* sampling of clays 89
2.9.3.2 *In situ* state of soil beneath an embankment 90
2.10 Permeability and consolidation 90
2.10.1 Permeability 90
2.10.2 Principle of one-dimensional consolidation (Terzaghi's theory) . . .92
2.10.3 Limitations of the validity of Terzaghi's theory 95
2.10.4 Primary and secondary consolidation 98

Chapter 3 — METHODS OF SITE INVESTIGATION AND MEASUREMENT OF SOIL PARAMETERS 100
3.1 Introduction 100
3.2 *In situ* methods of investigation 101
3.2.1 Geophysical methods 101
3.2.1.1 Seismic refraction 101
3.2.1.2 Electrical resistivity 102
3.2.1.3 Profiling 103
3.2.2 Cone penetration test and piezocone 103
3.2.3 Field vane 105
3.2.4 Methods of sampling for clay soils 106
3.2.4.1 Sampling and disturbance 106
3.2.4.2 Methods of sampling soft clays 107
3.2.4.3 General comments 109
3.2.5 Natural ground water conditions 109
3.2.6 Other methods of investigation 110
3.2.6.1 *In situ* estimation of K_0 110
3.2.6.2 Standard penetration test 110
3.2.6.3 Pressuremeter test 110
3.3 Laboratory identification tests 111
3.3.1 Mineralogical analysis 111
3.3.2 Water content 111
3.3.3 Grain size distribution 111
3.3.4 Unit weight 111
3.3.4.1 Unit weight γ 111
3.3.4.2 Unit weight γ_s of solid particles 112
3.3.5 Atterberg limits 112
3.3.5.1 Liquid limit w_L 113
3.3.5.2 Plastic limit w_P 114
3.3.5.3 Plasticity index I_P 114
3.3.5.4 Liquidity index I_L 114
3.3.6 Organic content 115
3.3.7 Carbonate content 115
3.4 Laboratory measurement of strength parameters 115

3.4.1 Introduction . . . 115
3.4.1.1 Peak strength and undrained strength of structured clay . 115
3.4.1.2 Strength of normally consolidated clay (critical state) . . . 116
3.4.2 Laboratory vane test . . . 117
3.4.3 Cone penetrometer test . . . 117
3.4.4 The triaxial apparatus . . . 118
3.4.5 Plane strain apparatus . . . 121
3.4.6 Direct shear apparatus . . . 121
3.4.7 Simple shear apparatus . . . 123
3.5 Laboratory measurement of compressibility parameters . . . 123
3.5.1 Introduction . . . 123
3.5.2 Equipment for performance of oedometer tests . . . 123
3.5.3 Conventional oedometer test . . . 124
3.5.4 Constant-rate-of-strain oedometer test . . . 126
3.5.5 Controlled-gradient oedometer test . . . 127
3.5.6 General comments . . . 127
3.6 *In situ* and laboratory measurement of permeability . . . 127
3.6.1 Introduction . . . 127
3.6.2 Laboratory measurement of permeability . . . 128
3.6.2.1 Methods of measurement . . . 128
3.6.2.2 Permeability testing in the oedometer . . . 129
3.6.2.3 Anisotropy of permeability . . . 129
3.6.3 *In situ* measurement of permeability . . . 129
3.6.3.1 Principles of *in situ* measurement of permeability of fine-grained soils . . . 129
3.6.3.2 Measurement of permeability with piezometers . . . 134
3.6.3.3 Measurement of permeability with self-boring permeameter . . . 134
3.7 Consolidation characteristics . . . 134
3.8 Correlations between properties of soft clays . . . 135
3.8.1 Principles . . . 135
3.8.2 Principal correlations . . . 136
3.8.3 Use and limitations . . . 138
3.9 Geotechnical summary of a site . . . 143
3.9.1 Geotechnical profile . . . 143
3.9.2 Geotechnical section . . . 145

Chapter 4 — BEHAVIOUR OF CLAY FOUNDATION SOILS . . . 147
4.1 General principles . . . 147
4.2 Behaviour during construction . . . 148
4.2.1 Construction pore pressures . . . 148
4.2.1.1 Initial consolidation . . . 149
4.2.1.2 Yielding (critical embankment height) . . . 150
4.2.1.3 Embankment heights greater than the critical height . . . 153
4.2.1.4 Particular case of heavily overconsolidated clays . . . 154
4.2.1.5 Behaviour before and during failure . . . 155

4.2.2 Consequences for settlements and lateral deformations during construction . . . 155
4.2.3 Consequences for strength mobilized at failure . . . 158
4.3 Behaviour after the end of construction . . . 161
4.3.1 Settlements . . . 161
4.3.1.1 Magnitude of settlements . . . 161
4.3.1.2 Rate of settlement . . . 163
4.3.1.3 Secondary settlements . . . 167
4.3.2 Lateral displacements . . . 167
4.4 Stage construction . . . 171
4.4.1 Pore pressures under the centre of the embankment . . . 172
4.4.2 Stability . . . 172
4.4.3 Lateral displacements . . . 174
4.5 Embankments constructed on soft clays treated with vertical drains . . . 176
4.5.1 Pore pressure . . . 176
4.5.2 Deformations and stability . . . 176
4.5.3 Consolidation after construction . . . 176

Chapter 5 — DESIGN METHODS . . . 177
5.1 General principles of design . . . 177
5.2 Summary of general principles of behaviour of clay embankment foundations . . . 178
5.3 Stability analysis: embankment constructed in one stage . . . 182
5.3.1 Reminders . . . 182
5.3.2 Methods of evaluation of τ_f . . . 183
5.3.2.1 Use of vane tests . . . 183
5.3.2.2 Use of oedometer tests . . . 185
5.3.2.3 Use of laboratory shear tests . . . 187
5.3.3 Strength of the weathered crust and of the embankment . . . 189
5.3.3.1 Strength of the weathered crust . . . 190
5.3.3.2 Strength of the embankment . . . 191
5.3.4 Method of calculation of safety factor . . . 192
5.3.4.1 Stability charts . . . 192
5.3.4.2 Computer calculation . . . 194
5.3.4.3 Calculation procedure . . . 195
5.4 Stability analysis: embankment constructed in several stages . . . 195
5.4.1 Reminders . . . 195
5.4.2 Stability analysis: first stage . . . 197
5.4.3 Estimation of strength increase due to consolidation . . . 197
5.4.3.1 Principles . . . 197
5.4.3.2 Limitations . . . 199
5.4.4 Calculation method . . . 200
5.4.5 Effective stress calculation and its limitations . . . 201
5.5 Calculation of settlements . . . 202
5.5.1 Reminders . . . 202
5.5.2 Construction settlement . . . 203

5.5.3 Settlements after construction: magnitude 206
5.5.3.1 Primary consolidation settlement 206
5.5.3.2 Effect of partial submergence of the soil or the embankment 209
5.5.3.3 Contribution of shear strains to total settlement 211
5.5.3.4 Contribution of secondary deformations to total settlement 212
5.5.4 Settlements after construction: rate 215
5.5.4.1 Nature of the phenomena 215
5.5.4.2 Numerical analysis of one-dimensional consolidation . . . 216
5.5.4.3 Terzaghi's one-dimensional solution 220
5.5.4.4 Two-dimensional solutions 222
5.5.5 Stage construction 222
5.6 Calculation of lateral displacements 223
5.6.1 Reminders 223
5.6.2 Horizontal displacements during construction 225
5.6.3 Horizontal displacements after the end of construction 228
5.6.4 Stage construction 231

Chapter 6 — NUMERICAL ANALYSIS OF BEHAVIOUR OF CLAY MASSES 232
6.1 Introduction 232
6.2 The numerical model 233
6.2.1 General remarks 233
6.2.2 The MELANIE model 233
6.2.3 Role of water in the behaviour of the soil mass 240
6.2.4 Comments 240
6.3 Finite element analysis 241
6.3.1 General remarks 241
6.3.2 Analysis of consolidation of elastic-plastic soil by the finite element method 241
6.4 Examples of analyses 245
6.4.1 General remarks 245
6.4.2 Failure analysis: embankment A, Cubzac-les-Ponts 246
6.4.3 Consolidation analysis: embankment B, Cubzac-les-Ponts 251
6.5 Conclusion 254

Chapter 7 — METHODS OF CONSTRUCTION 257
7.1 General remarks 257
7.2 Standard situation 259
7.2.1 General site management 259
7.2.2 Lower layers of the embankment 260
7.2.3 Selection and placement of fill material 260
7.3 Control of loading or timetable 260
7.3.1 Stage construction 260
7.3.2 Modification of the geometry of the embankment 262
7.3.3 Light-weight embankments 263

7.3.4 Temporary surcharge 266
7.4 Treatment of foundation soils 267
7.4.1 Vertical drains and drainage trenches 267
7.4.1.1 General remarks 267
7.4.1.2 Different types of vertical drain 268
7.4.1.3 Design of vertical drains 269
7.4.1.4 Monitoring of the effectiveness of vertical drains 271
7.4.1.5 Drainage trenches 271
7.4.2 Stone columns 273
7.4.3 Lime columns 274
7.4.4 Embankments on piles 275
7.4.5 Other methods 276
7.4.5.1 Replacement of foundation soil 276
7.4.5.2 Electro-osmosis; electro-injection 276
7.4.5.3 Dynamic compaction 277
7.5 Particular case of water retention structures 277

Chapter 8 — INSTRUMENTATION AND USE OF MEASUREMENTS 278
8.1 General remarks 278
8.2 Measurement equipment 279
8.2.1 Piezometers 280
8.2.1.1 Different types of piezometer 280
8.2.1.2 Installation of probes 280
8.2.2 Settlement gauges 283
8.2.2.1 Principal types of settlement gauge 283
8.2.2.2 Point surface- and deep-settlement gauges 284
8.2.2.3 Multipoint settlement gauges (extensometers) 285
8.2.3 Inclinometers 288
8.2.3.1 Principle of inclinometer measurement 288
8.2.3.2 Recommendations 289
8.2.3.3 Analysis of measurements 290
8.2.4 Other measurement equipment 291
8.2.4.1 Total stress gauges 291
8.2.4.2 Profile gauges 291
8.2.4.3 Measurement of relative horizontal deformation 292
8.2.4.4 Failure surface indicators 292
8.3 Instrumentation schemes 292
8.3.1 Standard structures 292
8.3.2 Trial embankments 294
8.3.3 Organization and frequency of measurements 294
8.4 Treatment of raw results 296
8.4.1 General principles 296
8.4.2 Pore pressures 296
8.4.3 Settlements 298
8.4.4 Horizontal displacements 300
8.5 Accuracy of measurements 300

8.5.1 General remarks 300
8.5.2 Pore pressures 301
8.5.3 Settlements 301
8.5.4 Horizontal displacements 302
8.6 Interpretation of results 302
8.6.1 Introduction 302
8.6.2 Interpretation of measurements made during the construction of the embankment 302
8.6.2.1 Verification of preconsolidation pressure σ'_p 303
8.6.2.2 Control of stability of the embankment 304
8.6.3 Interpretation of measurements made after the construction of the embankment 304
8.6.3.1 Analysis of settlement curves 304
8.6.3.2 Analysis of measured pore pressures 307
8.6.3.3 Global analysis of soil behaviour 308
8.6.3.4 Control of effectiveness of vertical drains 308

Chapter 9 — STRATEGY FOR DESIGN STUDIES 309
9.1 General remarks 309
9.2 Strategy for site investigations 310
9.2.1 The stages of the investigation 310
9.2.2 Preliminary appreciation of site and ground conditions 312
9.2.3 Outline site investigation 313
9.2.4 Detailed site investigation 314
9.2.5 Monitoring during construction and in the long term 316
9.3 Design criteria 316
9.3.1 Estimation of stability 317
9.3.2 Stage construction of embankments 318
9.3.3 Analysis of consolidation settlements 319
9.3.4 Methods of protection against settlement 319
9.3.5 Problems of lateral displacements 319
9.3.6 General considerations 320
9.4 Variability of properties of clays, and probabilistic methods 320
9.5 Monitoring during construction and in the long term 322
9.6 Use of trial embankments 324
9.6.1 Justification of trial embankments 324
9.6.2 Choice of site 326
9.6.3 Site investigation 326
9.6.4 Design of trial embankment 326
9.6.5 Instrumentation, construction and monitoring 327
9.6.6 Interpretation and extrapolation to actual project 327
