

**GEOLOGY
OF
HIGH-LEVEL
NUCLEAR
WASTE
DISPOSAL**

An introduction

I. S. ROXBURGH
BSc, MPhil, PhD, DMS

LONDON NEW YORK
Chapman and Hall

Contents

1 An introduction to high-level nuclear waste and the concept of geological disposal	1
1.1 Classification of nuclear waste	1
1.2 Origin of class I and II wastes	2
1.3 Amounts of waste involved	9
1.4 The nature of HLW and SURF	11
1.5 The need for containment	17
1.6 The concept of geological disposal of radioactive wastes	25
1.7 Criteria for a HLW geological repository	30
1.8 Non-geological methods of HLW disposal	38
1.9 Conclusions	39
2 The suitability of evaporites as HLW repositories	40
2.1 Introduction	40
2.2 Mineralogy and variability of evaporites	40
2.3 Physical properties of evaporites	44
2.4 Fluid inclusions in evaporites	48
2.5 Hydrogeology of evaporites	48
2.6 The rate of movement of salt diapirs	52
2.7 The effects of radiation on salt	55
2.8 Conclusions with respect to evaporites	55
3 The suitability of crystalline rocks as HLW repositories	57
3.1 Introduction	57
3.2 Mineralogy of granitic rocks	57
3.3 Physical and chemical properties of granites	60
3.4 The hydrogeology of granites	65
3.5 Effects of radiation on crystalline rock	70
3.6 Basalts	70
3.7 Tuffaceous rocks	71
3.8 Conclusions with respect to granitic and other crystalline rocks	73
4 The suitability of argillaceous rocks as HLW repositories	75
4.1 Introduction	75
4.2 Origin and composition of argillaceous rocks	75

4.3	The effect of heat on argillaceous rocks	84
4.4	The hydrogeology of clays	86
4.5	The ability of clays to retard the passage of radionuclides	87
4.6	Conclusions with respect to argillaceous rocks	93
5	The containment of radionuclides within repositories	94
5.1	The major physicochemical processes involved in radionuclide retardation	94
5.2	The study of natural analogues	95
5.3	Stabilizing waste forms	98
5.4	The waste canister	100
5.5	Buffer and backfill materials	107
5.6	Conclusions	110
6	Repository options, design and construction	112
6.1	Introduction	112
6.2	Repository site selection guidelines	112
6.3	Thermal loading in repositories	114
6.4	Subsurface excavation	115
6.5	Geothermal gradients	124
6.6	Examples of repositories	124
6.7	Backfilling and sealing repositories	143
7	Seabed disposal of high-level radioactive waste	145
7.1	Introduction	145
7.2	The London Dumping Convention	146
7.3	Criteria for the selection of seabed disposal sites	149
7.4	Sites under consideration for seabed disposal	152
7.5	The nature of the seabed sediments	153
7.6	Emplacement techniques	157
7.7	The waste form and the canister	165
7.8	Thermal effects on the sediment	167
7.9	The sediment as a barrier to radionuclide migration	169
7.10	The transportation of radionuclides from the seabed-water interface to the food chain	169
8	Groundwater and its movement	173
8.1	Introduction	173
8.2	The nature of groundwater and its ability to dissolve geochemical material and radionuclides	173
8.3	Movement of groundwater	175

8.4	Problems in defining the relevant hydrogeological parameters	181
8.5	Conclusions	183
9	Risk assessment and release scenarios for rock repositories	185
9.1	Introduction	185
9.2	Approaches to release scenarios and risk assessment	185
9.3	A time scale for predictions	191
9.4	Examples of generic and site-specific release scenarios	192
9.5	Conclusions regarding release scenarios and risk analysis	204
