

Developments in Geotechnical Engineering 31

LANDSLIDES AND THEIR CONTROL

*Second completely revised
edition*

by

QUIDO ZÁRUBA

*Emeritus Professor of Geology at the
Technical University, Prague, Czechoslovakia*

and

VOJTĚCH MENCL

*Emeritus Professor at the
Technical University, Brno, Czechoslovakia*

ELSEVIER SCIENTIFIC PUBLISHING COMPANY

Amsterdam · Oxford · New York · 1982

CONTENTS

Preface	9
Symbols	11
Chapter 1 Introduction	13
1.1 Definition and study of mass movements	13
1.2 Economic significance of landslides	14
Chapter 2 Factors causing mass movements	31
2.1 The relationship between slope movements and precipitation	32
2.2 Landslides in seismic regions	39
Chapter 3 The classification of slope movements	49
3.1. Geologico-morphological development of landslides	52
Chapter 4 Mechanics of the development of slope failures	54
4.1 General aspects	54
4.2 Failures arising at the toe of the slope	55
4.3 Failures arising within the slope	60
4.4 Failures occurring on the face of the slope at about its mid-height	65
4.5 Failures originating at the top of the slope	67
4.6 Complex modes of failure	67
4.7 Anisotropy of rocks	70
4.8 Arching in rocks	70
4.9 Slope movements in weak rocks	72
4.10 "Multi-storied" sliding	73
Chapter 5 Geological definition of the main landslide types	74
5.1 Slope movements of surface deposits	74
5.1.1 Talus creep and the terminal bending of beds	74
5.1.2 Sheet slides	75
5.1.3 Earthflows	77
5.1.4 The earthflow near Handlová	83
5.1.5 Debris flows, Muren	94
5.2 Landslides in clayey rocks	99
5.2.1 Landslides along rotational slide surfaces (slumps)	99
5.2.2 Landslides along composite slide surfaces	105
5.2.3 Slope movements caused by the squeezing out of soft rocks	110

5.3 Slides of solid rocks	121
5.3.1 Rockslides along pre-existing surfaces	121
5.3.2 Long-term deformations of mountain slopes (gravitational slides)	128
5.3.3 Rockfalls	133
5.4 Specific types of slope movement	136
5.4.1 Solifluction	136
5.4.2 Sensitive clays	137
5.4.3 Subaqueous slides	140
Chapter 6 Methods of landslide investigation	144
6.1 Field investigation	144
6.1.1 Survey of the landslide area	145
6.1.2 The use of aerial photographs	146
6.1.3 The use of geological maps	147
6.1.4 Directions for the detailed geological mapping of landslides	149
6.1.5 Hydrogeological research	156
6.1.6 Surveying the slide movement	157
6.1.7 Determination of the depth and shape of a slide surface	161
6.1.8 Field investigation of the mechanical properties of rocks	167
6.1.8.1 Deformation properties	167
6.1.8.2 Field shear tests	170
6.1.8.3 Determination of the density of sandy soils	171
6.1.9 Measurement of residual horizontal stress	171
6.2 Geophysical methods	175
6.3 Laboratory investigations	176
6.3.1 Mineralogical composition	177
6.3.2 Index properties of soils	178
6.3.3 Rate of consolidation under compression	179
6.3.4 Stress-strain parameters	181
6.3.5 Shear strength	184
Chapter 7 Stability analyses	187
7.1 Preliminary analysis during exploratory work	187
7.2 Method of analogy	187
7.3 Use of graphs	188
7.4 Numerical analysis	188
7.5 Classical solutions	191
7.6 The finite element method	195
7.7 The deformation approach to the stability of slopes	196
7.8 Physical models	198
7.9 The "cohesion approach"	199
7.10 The "horizontal equilibrium approach"	201
Chapter 8 Corrective measures	204
8.1 Scheduling of the stabilization work	204
8.2 Treatment of slope conformation	205
8.3 The drainage of landslides	208
8.3.1 Surface drainage	208
8.3.2 Subsurface drainage	210
8.4 Stabilization of landslides by planting	217

8.5 Retaining walls and similar structures	218
8.6 Rock bolts and rock anchors	221
8.7 Stabilization of landslides by piles and sheet-pile walls	225
8.8 The hardening of soils	229
8.9 The treatment of slip surfaces	233
Chapter 9 The prevention of slope failures — general considerations	234
Chapter 10 Mass movements and dam construction	237
10.1 Dam sites in valleys partly blocked by slipped masses	239
10.2 Landslides caused by construction work at dam sites	244
10.3 Slope movements occurring after filling of the reservoir and during operation	246
10.4 The effect of landslides on the permeability of the reservoir	254
Chapter 11 Landslides and road construction	257
11.1 Selection of the route	257
11.2 Preliminary work on the site	262
11.3 Cuttings	262
11.3.1 Deep failure of slopes in clayey rocks	263
11.3.2 The influence of water and frost	265
11.3.3 Slope failures in hard rocks	267
11.4 Embankments	270
11.4.1 Weakness of the subsoil due to poor consistency	270
11.4.2 Weakness of the subsoil due to the presence of water in thin sandy laminae within a clayey mass	271
11.4.3 Weakness of the subsoil caused by the uplift effect of ground-water supplied from underlying permeable strata	273
11.4.4 Embankments on steep slopes covered with unstable debris	274
11.5 Tunnels	275
Chapter 12 Landslides and urban planning	277
12.1 Engineering-geological investigation	278
12.2 Importance of the type of landslide in urban planning	279
12.3 Town planning and geological conditions	284
12.4 The influence of human activity	287
Chapter 13 Mass movements and the exploitation of mineral deposits	290
13.1 Underground mining	290
13.2 Opencast coal mining	292
13.2.1 Peculiarities of the static equilibrium of coal layers	292
13.2.2 Temporary working slopes	294
13.2.3 Final working slopes inside the coal basin	294
13.2.4 Slopes on the margins of brown-coal basins	296
13.3 Sliding of pit heaps	298
13.4 Open pits in stable rocks	299
13.5 Quarries and loam-pits	300
Bibliography	301
Index	316
