Contents

1	Introduction	1
2	State of the art	10
2.1	Theoretical models	10
2.1.1	Kinematic approaches	10
2.1.2	Static approaches	18
2.1.3	Other theoretical approaches	19
2.2	Experimental models	21
2.2.1	Centrifuge tests	22
2.2.2	1g model tests	29
2.3	Numerical models	31
2.3.1	Finite element analysis	32
2.3.2	Discrete element analysis	38
2.4	Case studies	39
2.5	Comparison of existing models	39
2.5.1	Example calculation	40
2.5.2	Sensitivity analysis	42
2.6	Engineering practice	46
3	Experimental investigation	50
3.1	Scaling laws	51
3.2	Qualitative investigation of face stability	55
3.2.1	Experimental setup and tested materials	55
3.2.2	Test procedure	57
3.2.3	Evaluation of soil displacements with Particle Image Velocimetry	61

3.2.4	Results	73
3.2.5	Interpretation of results	80
3.3	Quantitative investigation of the necessary support force	90
3.3.1	Experimental setup and tested materials	90
3.3.2	Test procedure	96
3.3.3	Results	98
3.3.4	Interpretation of results	104
3.4	Strength parameters for sand at low stress levels	109
3.5	Critical evaluation of qualitative and quantitative results	118
4	Numerical investigation	123
4.1	Brief introduction to finite element theory	125
4.2	Description and calibration of the applied material models	127
4.2.1	Mohr-Coulomb model	127
4.2.2	Hypoplastic model	131
4.2.3	Model calibration	133
4.2.4	Element test simulation	140
4.3	Parametric study for the numerical sandbox model	143
4.3.1	Modelling procedures for face stability analysis	146
4.3.2	Influence of numerical configuration	149
4.3.3	Influence of mesh size	152
4.4	Finite element simulations of the sandbox tests	156
4.4.1	Results	156
4.4.2	Interpretation of results	158
4.5	Comparison between numerical and experimental results	162
5	Summary and conclusions	163
A	List of symbols	A.1
B	Results of the force measurements	B.1
