HISTORICAL REVIEW OF THE DEVELOPMENT OF UNSATURATED SOIL MECHANICS	1
1.1 Historical progress in unsaturated soil mechanics literature: Karl Terzaghi's four books	1
1.2 Meetings, documents and books that were critical in establishing unsaturated soil mechanics as a sub-discipline of soil mechanics	10
1.2.1 Matrix suction	12
1.2.2 Solute (or osmotic) suction	13
1.3 Progress in disseminating knowledge of unsaturated soil mechanics via basic soil mechanics text books	18
1.4 The special problem of unsaturated soils	25
References	26
Plate	28
DETERMINING EFFECTIVE STRESSES IN UNSATURATED SOILS	29
2.1 The definition of an unsaturated soil	29
2.2 Interaction of pore air and pore water	32
2.3 The use of elevated pore-air pressures in the measurement of pore-water pressures (the axis translation technique) (Bishop & Blight, 1963)	35
2.4 The suction-water content curve (SWCC) (Blight, 2007)	38
2.4.1 Hysteresis in a saturated soil	39
2.4.2 Hysteresis in drying soils	40
2.4.3 Direct comparison between a consolidation curve and a SWCC	42

2.4.4	Hysteresis in compacted soils and the effect of particle size distribution	43
2.4.5	SWCCs extending to very dry soils, or high suctions	44
2.4.6	Empirical expressions for predicting SWCCs	46
2.4.7	The effect of soil variability on SWCCs and SWCCs measured by means of in situ tests	48
2.5	The characteristics of the effective stress equation for unsaturated soils (Bishop & Blight, 1963)	49
2.5.1	Evaluating the Bishop parameter χ or the Fredlund parameter ϕ^b	50
2.5.2	Evaluating χ from the results of various types of shear test, assuming that the equivalent test result for the saturated soil represents true effective stresses	53
2.5.3	Evaluating χ from compression, swelling and swelling pressure tests on the assumption that true effective stress behaviour of the unsaturated soil is represented by that of the same soil when saturated (Blight, 1965)	58
2.5.3.1	Isotropic compression	58
2.5.3.2	Isotropic swell	59
2.5.3.3	Swelling pressure	60
2.5.4	Summary of χ values from isotropic compression, swell and swelling pressure	60
2.5.5	The effect of stress path on values of χ	62
2.5.6	The χ parameter for compression of a collapsing sand	63
2.5.7	The parameter χ for extremely high values of suction	66
2.6	Incremental methods of establishing σ^t and χ	66
2.6.1	Shear strength	66
2.6.2	Volume change	70
2.6.3	Summary	70
2.7	Empirical methods of estimating parameter χ	73
2.8	The limits of effective stress in dry soils (Blight, 2011)	74
2.8.1	The experiment	75
2.8.2	The conclusion	77
	References	77
	Appendix A2: Equation for the solution of a bubble in a compressible container	79
	Plate	80
3	MEASURING AND CONTROLLING SUCTION	81
3.1	Direct or primary measurement of suction	81
3.1.1	Preparing the fine-pored ceramic	84
3.1.2	De-airing and testing fine-pored ceramic filters for air entry	84

3.1.3	The effects of capillarity on the de-airing process	86
3.1.4	Typical responses of tensiometers	87
3.1.5	Direct measurement of suctions exceeding 100 kPa	87
3.1.6	Null-flow methods of measuring suction	91
3.2	Indirect or secondary methods of measuring water content or suction	94
3.2.1	Filter paper	95
3.2.2	Thermal conductivity sensor	99
3.2.3	Electrical conductivity sensor	100
3.2.4	Time domain reflectometry (TDR)	102
3.2.5	Dielectric sensors	105
3.3	Thermodynamic methods of controlling or measuring suction	108
3.3.1	Control of relative humidity	108
3.3.2	Measuring relative humidity	111
3.3.2.1	Thermocouple psychrometer	112
3.3.2.2	Transistor psychrometer	114
3.3.2.3	Chilled-mirror psychrometer	115
3.4	A commentary on the use of the Kelvin equation as a measure of total suction	118
3.5	Use of direct and indirect suction measurements in the field	121
3.5.1	A comparison of field measurements of a suction profile using thermocouple psychrometers, contact and noncontact filter paper (van der Raadt, et al., 1987)	121
3.5.2	Near-surface changes of water content as a result of evapotranspiration (Blight, 2008)	121
3.5.3	A comparison of field measurements of suction by means of thermocouple psychrometers, gypsum blocks and glass fibre mats (Harrison & Blight, 2000)	123
3.5.4	Use of tensiometers to monitor the rate of infiltration of surface flooding into unsaturated soil strata (Indrawan, et al., 2006)	125
3.5.5	Use of suction gradients measured by gypsum blocks to examine the patterns of water flow in a stiff fissured clay (Blight, 2003)	128
3.5.6	Use of high tension tensiometers to monitor suctions in a test embankment (Mendes, et al., 2008)	130
3.5.7	Effect of covering the surface of a slope cut in residual granite soil with a capillary moisture barrier to stabilize the slope against surface sloughing (Rahardjo, et al., 2011)	132

3.6	A different application for measuring or controlling suction: Controlling alkali–aggregate reaction (AAR) in concrete, (Blight & Alexander, 2011)	134
3.6.1	Controlling alkali–aggregate reaction (AAR) in concrete	134

4	INTERACTIONS BETWEEN THE ATMOSPHERE AND THE EARTH'S SURFACE: CONSERVATIVE INTERACTIONS – INFILTRATION, EVAPORATION AND WATER STORAGE	145
4.1	The atmospheric water balance	146
4.2	The soil water balance	148
4.3	Measuring infiltration (<i>I</i>) and runoff (RO)	149
4.4	Estimating evapotranspiration by solar energy balance	155
4.5	Difficulties in applying the energy balance to estimating evaporation	158
4.5.1	Field experiments using a large cylindrical pan set into the ground surface (Blight, 2009a)	158
4.5.2	Field measurement of the water balance for a landfill	160
4.5.3	Evaporation from experimental landfill capping layers	161
4.5.4	Evaporation from a grassed, fissured clay surface (Clarens, South Africa)	162
4.5.5	Near-surface movement of water during evapotranspiration	168
4.5.6	Drying of tailings beaches deposited on tailings storage facilities	169
4.6	Fundamental mechanisms of evaporation from water and soil surfaces	173
4.6.1	Water or soil heat as sources and drivers of evaporation	173
4.6.2	The role of wind energy	176
4.7	Evaporation from unsaturated sand and the effect of vegetation – the efficiency factor η	178
4.8	Fundamental mechanisms of evaporation – discussion	180
4.9	Estimating evapotranspiration by means of lysimeter experiments	181
4.10	Depth of soil zone interacting with the atmosphere (also see section 4.5.5)	184
4.11	Recharge of water table and leachate flow from waste deposits	191
4.12	Estimating and measuring water storage capacity (<i>S</i>) for active zone	192
4.13	Seasonal and longer term variations in soil water balance	198

4.14	Consequences of a changing soil water balance	200
4.14.1	Effects on soil strength of a falling water table (also see section 8.8.1)	200
4.14.2	Effects of a rising water table – surface heave (also see section 8.6.2)	202
4.15	Cracking and fissuring of soil resulting from evaporation or evapotranspiration at the surface	206
4.15.1	Stresses in a shrinking soil	206
4.15.2	Cracking in a shrinking soil	208
4.15.3	Formation of shrinkage cracks at the surface	209
4.15.4	Formation of shrinkage cracks at depth	210
4.15.5	Characteristics of cracking observed in soil profiles	211
4.15.6	The formation of swelling fissures	211
4.15.7	Fissures in profiles that seasonally shrink and swell	211
4.15.8	Spacing of cracks on the surface	212
4.16	Damage to road pavements by upward migration of soluble salts	214
4.17	Root barriers to protect foundations of buildings from desiccating effects of tree roots (Blight, 2011)	216
4.17.1	Installation of root barriers	216
4.17.2	Effect of felling the tree	218
4.17.3	Examination of the exhumed root barriers	218
4.17.4	Conclusions	220
4.18	Use of an unsaturated soil layer to insulate flat (usually concrete) roofs (Gwiza, 2012)	220
4.19	Practical examples involving infiltration, evaporation and water storage	222
4.19.1	The infiltrate, store and evaporate (ISE) landfill cover layer (Blight & Fourie, 2005) (also see Fig. 4.11)	222
4.19.1.1	The influence of climate on landfilling practice	222
4.19.1.2	Dry tomb versus bioreactor	223
4.19.1.3	Water content of incoming waste	223
4.19.1.4	Stabilization in arid and semi-arid conditions	224
4.19.1.5	Evaporation from a landfill surface	224
4.19.1.6	Infiltrate-stabilize-evapotranspire (ISE) landfill covers	225
4.19.1.7	Field tests of ISE caps under summer and winter rainfall conditions	226
4.19.1.8	Rainfall infiltration and water storage	227
4.19.1.9	Concluding discussion	229
4.19.2	The effect of raising the height of a MSW landfill in a semi-arid climate	232
4.19.2.1	Introduction	232
4.19.2.2	Some effects of raising the height of a landfill	234

4.19.2.3	The measuring cells and their prior use	235
4.19.2.4	The experimental raising and its effect on settlement and leachate flow	237
4.19.2.5	Relationship between leachate quality and leachate flow rate	240
4.19.2.6	Compression characteristics of waste	241
4.19.2.7	Summary and conclusions	242
4.19.3	Interaction of pore air with steel reinforcing strips to cause accelerated corrosion in a reinforced compacted unsaturated soil structure	243
4.19.3.1	Introduction	243
4.19.3.2	Corrosion cause and progress	244
	References	248
	Appendix A4	253
A4.1	Calculating G , WH , H	253
A4.2	Calculating k_r	254
A4.3	Conversion of volumetric water content w_v to gravimetric water content w_g	255
	Plates	256
5	INTERACTIONS BETWEEN THE ATMOSPHERE AND THE EARTH'S SURFACE: DESTRUCTIVE INTERACTIONS – WATER AND WIND EROSION, PIPING EROSION	263
5.1	Factors controlling erosion from slopes	263
5.1.1	Results of early erosion measurements	264
5.1.2	Wind erosion compared with water erosion	266
5.1.3	Acceptable erosion rates for slopes	267
5.2	The mechanics of wind erosion	269
5.2.1	Variation of wind speed with height above ground level	270
5.2.2	Erosion and transportation by wind	271
5.3	Wind speed profiles over sand dunes and tailings storages	272
5.4	Wind tunnel tests on model waste storages	273
5.5	Wind flow over top surface of storage	275
5.6	Observed erosion and deposition by wind on full size waste storages	277
5.7	Protection of slopes against erosion by geotechnical means	277
5.7.1	Gravel mulching	279
5.7.2	Rock cladding	279
5.8	Full-scale field trials of rock cladding and rock armouring	280
5.9	Comments on wind and water erosion	281
5.10	Dispersive soils and piping erosion	282
5.11	Examples of piping erosion occurring in acid mine tailings	284

5.12	Other examples of failures by piping erosion	286
5.12.1	Failure of Teton dam (USA) (Seed & Duncan, 1981)	287
5.12.2	Gennaiyama and Goi dams (Japan) – failure by piping along outlet conduits (N'Gambi, et al., 1999)	291
5.12.3	Cut-off trench, Lesapi dam, Zimbabwe – stresses indicate piping unlikely (Blight, 1973)	295
5.12.4	Concrete spillway, Acton Valley dam, South Africa, piping along soil to concrete interfaces	296
5.12.5	Termite channels and piping flow	300
